

Access IQ Device Resource Pending

This bundled PDF appears when a calculator device is selected before a model-specific manufacturer installation sheet has been imported into Access IQ.

Why this page exists

Every device in the calculator must display a PDF preview. Some library entries currently point to manufacturer search portals or product-support pages instead of a direct PDF file. Access IQ uses this placeholder so the preview area is never blank or broken while still avoiding made-up electrical specifications.

Installer workflow

1	Use the selected device preset as a planning entry.
2	Open the manufacturer product page or document library from the resource card when available.
3	Import the exact installation PDF or enter voltage/current values from the manufacturer sheet before final approval.
4	Verify voltage at the device under load during commissioning.

Calculation note

If the calculator marks current, voltage range, or wire-run guidance as unknown, the result is a planning placeholder. Do not treat unknown manufacturer data as an installation approval.

Nuerolynx Access IQ - resource fallback document. Replace this with the exact manufacturer PDF as the product library grows.
